

LINKY

Work Report

Developer

Achraf Benamrane

Date

14 June 2026

Project

Linky — marketplace + real-estate app (Guinea)

Stack

Expo / React Native · Supabase · Stripe · escrow wallet

Status

✓ V1 complete & fully bilingual (FR/EN)

Major feature + reliability day on top of the V1 base. Delivered the client APK on the landing page, fixed two data-integrity blockers that were corrupting every new listing, shipped profile photos (mobile + backend + admin), card-funded wallet recharge (Stripe), and a seller/agent editing pass (shop, listings, stats). Closed it out by taking the whole app fully bilingual (French / English, ~1275 keys, live switching). Four independent adversarial reviews were run across the new money/identity surfaces; every confirmed finding was fixed and the backend functions were redeployed and probed healthy. Everything committed on **main**.

What was delivered

Full internationalization — French / English

The entire app is now bilingual: every buyer, seller and agent screen, settings, and the legal documents. ~1275 translation keys, live language switching, with module-scope "frozen string" arrays correctly resolved at render. Pular & Soussou are scaffolded as complete skeletons with a CSV round-trip so the client's translators can fill them in with zero code changes. (Phases I.1 → I.3j, ~20 commits.)

Create-flow data-integrity blockers fixed BLOCKER

Two bugs were corrupting every new listing: (1) the product wizard never collected a **city** — every product shipped with an empty city, invisible to the marketplace city filter; (2) the property wizard had no **type selector** — every listing defaulted to a rental, so agents could not list sales or land at all. Built a reusable curated city picker (over the canonical Guinea city list) and added the location/vente/terrain selector. Hardened after an adversarial review (terrain clears stale fields, preview gates on city, etc.).

Profile photos — mobile + backend + admin

Users can set a profile photo from edit-profile (pick → square crop → upload). New backend: a public avatars storage bucket, an avatar kind on the signed-upload endpoint, and update-profile accepting a validated avatar_url (must resolve to our own storage). The admin Users table renders the avatar. Security-reviewed and hardened — also closed a pre-existing gap where shop cover/logo URLs were unvalidated.

Card-funded wallet recharge (Stripe top-up)

The "Recharge" screen now works end to end: enter an amount → Stripe payment sheet → the wallet is credited via the webhook → ledger. New `wallet-topup-card` function + a top-up branch in the Stripe webhook that reuses the idempotent `confirm_topup` RPC. A money/abuse review caught a missing settled-amount check (the order rail has it, the top-up branch didn't) — added. Works in Stripe test mode; real money is a live-key swap. Orange/MTN recharge stays blocked on the Lengopay contract.

Seller / agent editing pass

Audited the seller/agent surfaces (money flows, visits and growth tools were already real). Closed the editing gaps: a new **shop-edit** screen (name, city, logo, cover, about) wired to the previously dead identity pill; **listing edit** for products and properties (was status-only); a "waiting for payment" message on unpaid orders; and the **stats** screen now counts properties too — an agent previously saw "0" despite having viewed listings.

Withdrawal screen rebuilt

The payout was un-actionable — it recorded a destination of "Orange Money" with no phone number, so an admin had nothing to pay out to. Rebuilt with a mobile-money number field, an editable amount, branded operator rows, balance validation, and proper empty/loading/error states.

Catalogue reliability

Home category tiles now land on the correct filtered products — the tile codes were misaligned with how products are actually stored; aligned them and added the missing "Services" filter. Removed the top home search box per request.

Landing page — client APK delivery

Added a working Android APK download button on the landing page (stable hosting, clean `/linky.apk` filename), App/Play Store "coming soon" badges, a responsive pass, and a branded URL — so the client can install directly from the landing.

Cleanup & backend ops

Deleted 5 orphaned mock data files (774 lines) and fixed the stale README. Deployed the updated edge functions (photo-upload-url, update-profile, shop-upsert, wallet-topup-card, stripe-webhook), all verified healthy with the garbage-bearer probe; provisioned the avatars storage bucket.

Adversarial reviews

Ran four independent multi-agent reviews — create-flow fixes, the avatar feature, the seller/agent audit, and the card top-up (money/abuse). Folded in the real findings (e.g. the top-up amount validation, terrain stale-field clearing, the shop-upsert URL gap) and rejected the false positives after verifying against the code.

Commits (highlights)

```
fix(wallet):    rebuild the Retirer screen + make payouts actionable
fix(create):    collect product city + property type (data-integrity blockers)
fix(create):    harden create-flow fixes after adversarial review
feat(profile):  let users set a profile photo (mobile + backend + admin)
fix(profile):   harden avatar URL validation + remove-photo affordance
feat(seller):   editable boutique + wire dead IdentityPill + order wait state
```

```
feat(seller/agent): edit a published listing (product + property)
fix(stats):        include properties, not just products
fix(browse):       category tiles now match stored product codes
feat(wallet):      card-funded recharge (Stripe top-up) – frontend + backend
fix(wallet):       validate settled amount in topup webhook (review follow-up)
chore:             delete orphaned mock data files + fix stale README
feat(phase-I*):    full FR/EN internationalization – setup → seller/agent sweep (~20 commits, ~1275 k
```

Status & next steps

-  **V1 is feature-complete and fully bilingual** — every flow works end to end; the app now switches FR ↔ EN live on every screen.
-  **Pending on the client side** (each a same-day activation): Lengopay contract → Orange/MTN payments; US LLC + live Stripe keys → real card payments & recharge; Apple Developer account → iOS; Firebase / APNS credentials → push delivery on devices; brand assets → final identity.
-  **Pre-launch cutover** (right before release): drop the demo-seed wallet trigger, gate the dev OTP echo, then produce the signed production APK.
